## **Cheat Sheet: API's and Data Collection**

```
Package/Method Description
                                                                                                      Code Example
                               Syntax:
                                  1. 1
                                  1. attribute = element[(attribute)]
                 Access the
                 value of a
                                Copied!
                 specific
Accessing
                attribute of an Example:
element attribute
                HTML
                element.
                                  1. 1
                                  1. href = link_element[(href)]
                                Copied!
                               Syntax:
                                  1. 1
                 Parse the
                HTML content
                                  1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                                Copied!
                using
BeautifulSoup()
                BeautifulSoup.
                               Example:
                 The parser
                 type can vary
                                  1. 1
                based on the
                project.
                                  1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                                Copied!
                               Syntax:
                 Send a
                DELETE
                                  1. 1
                request to
                                  1. response = requests.delete(url)
                remove data or
                a resource
                               Copied!
                from the
delete()
                 server.
                               Example:
                 DELETE
                requests delete
                a specified
                                  1. response = requests.delete((https://api.example.com/delete))
                resource on
                the server.
                               Copied!
                               Syntax:
                                  1. 1
                                  1. element = soup.find(tag, attrs)
                Find the first
                HTML
                                Copied!
                element that
find()
                matches the
                               Example:
                specified tag
                and attributes.
                                  1. 1
                                  1. first_link = soup.find((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. elements = soup.find_all(tag, attrs)
                Find all
                HTML
                                Copied!
                 elements that
find_all()
                match the
                               Example:
                 specified tag
                and attributes.
                                  1. all_links = soup.find_all((a), {(class): (link)})
                                Copied!
                Find all child
findChildren()
                               Syntax:
                elements of an
                HTML
                element.
                                  1. children = element.findChildren()
                               Copied!
                               Example:
```

```
Copied!
                 Perform a
                 GET request
                 to retrieve data
                 from a
                               Syntax:
                 specified
                                  1. 1
                 URL. GET
                 requests are
                                  1. response = requests.get(url)
                 typically used
                                Copied!
                 for reading
get()
                 data from an
                 API. The
                               Example:
                 response
                                  1. 1
                 variable will
                 contain the
                                  1. response = requests.get((https://api.example.com/data))
                 server's
                                Copied!
                 response,
                 which you can
                 process
                 further.
                 Include
                               Syntax:
                 custom
                                  1. 1
                 headers in the
                 request.
                                  1. headers = {(HeaderName): (Value)}
                 Headers can
                                Copied!
                 provide
Headers
                 additional
                 information to Example:
                 the server,
                 such as
                 authentication
                                  1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.get(bas
                 tokens or
                               Copied!
                 content types.
                               Syntax:
                 Import the
                 necessary
                                  1. 1
Import Libraries
                 Python
                                  1. from bs4 import BeautifulSoup
                 libraries for
                 web scraping.
                               Copied!
                 Parse JSON
                 data from the
                 response. This
                               Syntax:
                 extracts and
                 works with the
                 data returned
                                  1. data = response.json()
                 by the API.
                response.json() Copied!
json()
                 method
                               Example:
                 converts the
                 JSON
                                  1. 1
                 response into a
                                  1. response = requests.get((https://api.example.com/data)) data = response.json()
                 Python data
                 structure
                                Copied!
                 (usually a
                 dictionary or
                 list).
                               Syntax:
                                  1. 1
                                  1. sibling = element.find_next_sibling()
                 Find the next
                                Copied!
                 sibling
next_sibling()
                 element in the Example:
                 DOM.
                                  1. next_sibling = current_element.find_next_sibling()
                                Copied!
parent
                 Access the
                               Syntax:
                 parent element
                 in the
                 Document
                                  1. parent = element.parent
                 Object Model
                                Copied!
                 (DOM).
```

1. child\_elements = parent\_div.findChildren()

Example:

```
1. parent_div = paragraph.parent
                                  Copied!
                  Send a POST
                  request to a
                                 Syntax:
                  specified URL
                                    1. 1
                  with data.
                  Create or
                                    1. response = requests.post(url, data)
                  update POST
                  requests using
                                 Copied!
post()
                  resources on
                  the server. The Example:
                  data parameter
                  contains the
                  data to send to
                                    1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                  the server,
                  often in JSON Copied!
                  format.
                  Send a PUT
                  request to
                                 Syntax:
                  update data on
                  the server.
                  PUT requests
                                    1. response = requests.put(url, data)
                  are used to
                  update an
                                  Copied!
                  existing
put()
                  resource on
                                 Example:
                  the server with
                  the data
                                    1. 1
                  provided in the
                                    1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                  data
                  parameter,
                                  Copied!
                  typically in
                  JSON format.
                                 Syntax:
                  Pass query
                                    1. params = {(param_name): (value)}
                  parameters in
                  the URL to
                                  Copied!
                  filter or
                  customize the Example:
Query parameters request. Query
                  parameters
                  specify
                                    2. 2
                                    3.3
                  conditions or
                  limits for the
                                    1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                  requested data.
                                  Copied!
                                 Syntax:
                                    1. 1
                                    1. element = soup.select(selector)
                  Select HTML
                                 Copied!
                  elements from
select()
                  the parsed
                  HTML using a Example:
                  CSS selector.
                                    1. titles = soup.select((h1))
                                  Copied!
status code
                  Check the
                                 Syntax:
                  HTTP status
                  code of the
                  response. The

    response.status_code

                  HTTP status
                  code indicates | Copied!
                  the result of
                  the request
                                 Example:
                  (success, error,
                  redirection).
                                    2. 2
                  Use the HTTP
                                    3. 3
                  status codeIt
                  can be used for
                                    1. url = "https://api.example.com/data"
                                    2. response = requests.get(url)
                  error handling
                                    3. status_code = response.status_code
                  and decision-
